Arjona AA;

This cDNA clone codes for novel human low density lipoprotein (LDL) binding protein LBP-3 (see AAW49042). It was isolated by screening human liver, ancrta and foetal brain cDNA libraries with rabbit LBP-3 cDNA. CDNA clones (see AAV32834-39) and encoded trabbit and human LBPs (see AAW49037-42) are claimed. An abnormality in LBP metabolism or structure is diagnostic of a risk for atherosclerosis. The invention provides: methods for determining if an animal is at risk for atherosclerosis (e.g. for prenatal screening); methods for treating atherosclerosis (including gene formation of atherosclerotic plaque; and methods for treating a cell having an abnormality in LBP structure or metabolism. Pharmaceutical and vaccine compositions are also provided, as well as recombinant vectors Nucleic acid encoding low density lipoprotein binding proteins and related vectors - transformed cells, proteins, and modulators of binding, useful for treatment and diagnosis of atherosclerosis and for identifying Claim 10; Fig 17; 47pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of a partial cDNA encoding novel human low density lipoprotein binding protein 3 (LBP-3, see AAB82804). Clones were isolated from human foetal brain, liver and aorta cDNA libraries using rabbit LBP-3 cDNA as probe. A full-length cDNA clone is given in AAH26501, and a genomic DNA sequence is given in AAH26497. LBP-3 nucleic acids are among claimed polypucleotides of the invention that encode novel polypeptides capable of binding to native and methylated LDL. Also claimed are isolated LBP polypeptides, and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormality in structure or metabolism of LBP are claimed. Pharmaceutical compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions, are also claimed

The present sequence is that of the coding region of the human gene (see also AAH26496) encoding novel human low density lipoprotein binding protein 2 (IBP-3, see AAB82808). The gene was isolated from a genomic DNA library using 1BP-3 conh as probe. The IBP-3 protein predicted from the present sequence differs from that predicted from a cDNA clone (see AAB82804) in that it contains an additional 16 amino acids at its N-cermins (the cDNA is a 5' truncation) and has Asn at amino acid position 130 rather than Tyr: LBP-3 nucleic acids are among claimed cof binding to native and methylated LDL. Also claimed are isolated LBP colymucleotides of the invention that encode novel polypeptides capable of binding to native and methylated LDL. Also claimed are isolated LBP colympeptides, and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at risk for atherosclerosis, methods for treating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormality in structure or cemptained or nucleic acid, and vaccine compositions, are also claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GCTGAACTGCTGGAGGAGCACCGGAATTCACAGAAGCAGATGAAGCTCCTACAGAAAAAG 648

Tang YT, Liu C, Drmanac RT;

WPI; 2001-457740/49. P-PSDB; ABB11764. Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis

Claim 1; Page 693-694; 1963pp; English.

concentration bolypepides, and recombinant polypepides, and sequences Abblob25-AbbA0574 represent laby mover number of sequences Abblob25-AbbA0574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of detecting the nucleotides of nucleotides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the competition are not properties of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence polypeptides of the invention activities activities, including cytokine, cell proliferation or cell differentiation activities; including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; chemocopies required activities; homogonic or chemochatory activity; activin. or inhibin-related activities; chemocopies required activities; becaptor or liagand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Compending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haemacopolesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include cancers, haemacopolesis, or representing or ameliorating medical activities polypeptides and nucleotides of proliferative retinopathy, atherocaclerosis, occonary heart disease.

Conditions, e.g., by protein or gene therapy. Such conditions include activities and include activities involved with tissue regeneration and repair (or nucleic acide encoding them) may be used to promote wound repair (or nucleic acide encoding them) may be used to promote wound immunomodulatory activities un activity may be used in cell cu Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and

\$88 888 888	promote cell g manipulate ste that can be us autoimmune dis may also be us screening tech novel human po	promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by lilness, autoimmune disease or accidental damage. The polypeptides and nuclectides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention

The invention relates to polymucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetric activity in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

CC recombinant production adjusted and theas was least by a factorial to the altupy curva compounds sequences of the invention; recombinant vectors, host calls and transgenic organisms comprising a dithp nucleic acid sequence; the recombinant production of DITHP proteins; antibodies specific for DITHP proteins; microarrays comprising dithp nucleic acid sequences; methods of screening for compounds which specifically bind a DITHP protein; and methods of screening for compounds which specifically bind a DITHP protein; and methods of disposes in the toxicity of test compounds using a dithp hybridisation probe. Dithp nucleic acid sequences and DITHP protein; and methods of disposes of a wide variety of conditions including cancer and other cell proliferative disorders; autoimmune or inflammatory disorders; bacterial, viral, fungal or parasitic infections; hormonal disorders; metabolic proliferative disorders; gastrointestinal disorders; transport disorders; and connective tissue disorders. They may also be used to screen for modulators of protein activity or gene expression. DITHP proteins can additionally be used in analysis of the proteome of a tissue or cell type and to induce antibodies. The dith nucleic acids are additionally useful in somatic or germline gene therapy of the disorders mentioned above, as a source of antisense sequences, as a source of probes and primers, in genotyping and identification of individuals, in the generation of transgenic animal models of human isease or knock in humanised animals, in toxicological testing, and in transcript imaging. The present sequence represents a ditho DNA encoding a DITHP procein which has extracellular signalling activity. Note: The sequence data for the primer intering from protein animal of the primers of the primers of the primers of the primers of the primers of the present sequence represents a ditho DNA encoding a DITHP procein which has extracellular signalling activity. Note: The sequence data for the primer intering the discorder of the primers of th

(INCY-) INCYTE GENOMICS INC.

Novel human diagnostic and therapeutic polypeptide useful for identifying test compound which specifically binds to a polypeptide encoded by human diagnostic and therapeutic polynucleotide, and to induce antibodies.

Claim 2; SEQ ID NO 74; 591pp; English.

The invention relates to novel human diagnostic and therapeutic polynucleotides designated dithp (ACC46080-ACC46749) and to their encoded proteins (DITHP; ABR41136-ABR41812). The invention also relates to

(INCY-) INCYTE GENOMICS INC.

2003-129518/12. P-PSDB; ABR41186 Novel human diagnostic and therapeutic polypeptide useful for identifying test compound which specifically binds to a polypeptide encoded by human diagnostic and therapeutic polynucleotide, and to induce antibodies.

Claim 2; SEQ ID NO 51; 591pp; English.

The invention relates to novel human diagnostic and therapeutic polynucleotides designated dithp (ACC46080-ACC46749) and to their encoded proteins (DITHP, ABR4136-ABR4812). The invention also relates to proteins (DITHP, ABR4136-ABR4812). The invention also relates to polynucleotide sequences at least 90% identical to the dithp cDNA sequences of the invention; recombinant vectors, host cells and transpenic organisms comprising a dithp nucleic acid sequence; the recombinant production of DITHP proteins, antibodies specific for DITHP proteins; microarrays comprising dithp nucleic acid sequences; methods of detecting dithp nucleic and protein sequences; methods of sessing the toxicity of test compounds using a dithp hybridisation probe. Dithp nucleic acid sequences and DITHP protein; and methods of assessing the toxicity of test compounds using a dithp hybridisation probe. Dithp nucleic acid sequences and DITHP proteins may be used in the diagnosis of a wide variety of conditions including cancer and other call confiferative disorders; autoimmune or inflammatory disorders; bacterial, viral, fungal or parasitic infections; hormonal disorders; metabolic disorders; and connective tissue disorders. They may also be used to

screen for modulators of protein activity or gene expression. DITHP proteins can additionally be used in analysis of the proteome of a tissue additionally useful in somatic or germline gene therapy of the disorders and additionally useful in somatic or germline gene therapy of the disorders mentioned above, as a source of antisense sequences, as a source of probes and primers, in genctyping and identification of individuals, in the generation of transgenic animal models of human disease or knock in the present sequence represents a dithp obly ending and in transcript imaging. The present sequence represents a dithp obly note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

This cDNA clone codes for novel rabbit low density lipoprotein (LDL) binding protein LBP-3 (see AAM49039). It was isolated by functional screening of a cDNA library, produced from balloon-dendchehialised healing rabbit abdominal aorta mRNA, for clones encoding LBPs able to bind both native and methyl LDL. cDNA clones (see AAV32834-39) and encoded rabbit and human LBPs (see AAW49037-42) are claimed. An chorded rabbit and human LBPs (see AAW49037-42) are claimed. An abnormality in an aspect of LBP metabolism or structure is diagnostic of a risk for atherosclerosis. The invention provides: methods for cheranting if an animal is at risk for atherosclerosis (e.g. for prenatal screening); methods for treating atherosclerosis (including therapy) using e.g. LBP polypeptides to bind LDL and thereby prevent formation of atherosclerotic plaque; and methods for treating a cell compation of atherosclerotic plaque; and methods for treating a cell vaccine compositions are also provided, as well as recombinant vectors and host cells used to produce recombinant LBP Nucleic acid encoding low density lipoprotein binding proteins and related vectors - transformed cells, proteins, and modulators of binding, useful for treatment and diagnosis of atherosclerosis and for identifying Sequence 4722 BP; 997 A; 1332 C; 1430 G; 963 T; 0 U; 0 Other; Claim 7; Fig 14; 47pp; English. subjects at risk

The present sequence is that of cDNA encoding novel rabbit low density lipoprotein binding protein 3 (LBP-3, see AAB22801). The cDNA was solated following screening of a rabbit cDNA library for clones encoding LBPs that bound to both native low density lipoprotein (LDL) and methyl LDL. The invention provides claimed polynucleotides encoding novel

treating,

New isolated low density lipoprotein binding polypeptide for treating diagnosing and/or identifying therapeutic agents for atherosclerosis.

Claim 5; Fig 14; 143pp; English

```
polypeptides which are capable of binding to native and methylated LDL, the isolated polypeptides, termed LBPs, and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Also claimed are methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormality in structure or metabolism of LBP. Pharmaceutical compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions, are also claimed
                                                                                                                                                                                                                                                                                                                                                                          168

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic conding sequences. AAS64197-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in procession of commentations.                                        The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or egeptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, infinibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK22581), 2111
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GAGAAGTTTGAGGAGTTCCAGAACACACTTTCCAAAAGCAGCGAGGTATTCACCACATTC 1017

The present sequence is one such sequence. This sequence can be used for diagnosing osteoporosis/bone disease in a patient, promoting osteogenesis and/or preventing osteoporosis/bone disease. The present sequence encodes a secreted

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets on unclaic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airway, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating conditions, pulmonary vasoconstriction, allergies, asthma, impaced respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD) and cancers such as leukaemias, lymphomas, containings, and cancers which may metastasise to the lungs, including carcinomas, and cancers which may metastasise to the lungs, including carcinomas, and cancers which any metastasis to the lungs, including carcinomas, and cancers which activates adenosine content of the content of the adenosine which activates adenosine receptors causing chroniconstriction and inflammation. AAA32131 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present contention, which correspond to SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1860 (AAA33233 to AAA3392) are specifically claimed ONS from the present invention. N.B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 1259-1260; 1343pp; English

Disclosure; Page 1259; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, altialergic, and/or inflammation. The ON can have antihiflammatory, antialergic, antiasthmatic: cytostatic and analgesic activities. The compositions are useful for the treatment of disease associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs pulmonary vascocnstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (OCDPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers such as leukaemias, lymphomas, obreast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing

                                                      The present invention describes low adenosine (A) content antisense cligonucleotides and compositions (I) comprising them. In the antisense cligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodiator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense cligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cury training peptide factors and malignancies, such as stimulating and cetivating peptide factors and malignancies, such as stimulating and cetivating peptide factors and transmitters, cytokines and chemokine ecceptors, denocals and their receptors, cytokines and chemokine receptors, adenocals and their receptors, cytokine and chemokine receptors, adenocane receptors, bradykinin receptors, contral nervous system (CNS) and peripheral nervous and non-nervous system ceceptors, binding proteins and malignancy associated proteins. The receptors binding proteins and malignancy associated proteins. The creeptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lump inflammation, allergy (ies) and/or condition selected from pulmonary vasoconterion inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1732

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antihiflammatory steroid and ubiquinone. A composition of the invention has antihiflammatory, antiallargic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antihilammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung all mamation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at first property disease or condition. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or Disclosure; SEQ ID NO 12276; 872pp; English ubiquinone

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antiense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entinflammatory steroid and ubjuding the composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine reducing levels of corrector, producing bronchodilation, increasing levels of ubjuingne or Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences Aguilar D; Pabalan J, Disclosure; SEQ ID NO 12275; 872pp; English Katz E, Sandrasagra A, K ,, Shahabuddin S; Li Y, Sar Tang L, WPI; 2003-229219/22 ubiquinone Nyce JW, Miller S,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GluSerGlnArgMetCysGluLeuMetLysGlnGlnGluThrHisLeuLysGlnGlnLeu 371
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AlaLeuTyrThrGluLysPheGluGluPheGlnAsnThrLeuSerLysSerSerGluVal 391
                                                                                                                                                                                                                                    The sequence is that of a gene encoding a high molecular weight B cell growth factor which stimulates B cell proliferation and inhibits B cell differentiation, termed interleukin 14. IL-14 can be used to interfere with the replication of B cells and to treat B cell non-Hodgkin's lymboma, systemic lupus errythematosus and systemic necrotising vaculitis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                High molecular weight B cell growth factor - able to stimulate B cell proliferation and inhibit B cell differentiation, useful to treat e.g. systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ArgGlyGluHisSerLysAlaValLeuAlaArgSerLysLeuGluSerLeuCysArgGlu

complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence. The polynucleotide which comprises a 1'-end sequence, where the oligonucleotide which comprises a 1'-end sequence, where the oligonucleotide which comprises a 1'-end sequence, where the combination of the 5'-end sequence 3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the partection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs rapesent human cond methods. Page 175-176; 189pp; English. Claim 1;

The invention relates to an isolated polynuclectide comprising a sequence selected from 183 human DNA sequences (appearing as ABX70130-ABK70312), or their fragments, homologues, variants or complements and their encoded polypeptides. Also included are an expression vector comprising the polynucleotide operably linked to an expression vector of; an isolated cell transformed or transfected with an expression control sequence; a host cell transformed or transfected with an expression vector of; an isolated cell transformed or transfected with an expression vector of; an isolated cell transformed or transfected with an expression vector of; an isolated cell transformed or transfected with an expression vector of; an isolated cell polypeptide; an enthod for detecting the presence of a cancer in a patient of a fusion protein comprising at least the polypeptide and incleased to expending T cells specific for a tumour protein; an isolated T cell population comprising T cells specific for a tumour protein; an isolated T cell population comprising T cells specific for a tumour protein; an isolated T cell population a first component selected from the polynucleotides, proteins, antibodies, fusion of component selected from the polynucleotides, proteins, and a second component selected from the polynucleotides, proteins, and an expension of selection reagent consisting of a reporter group. The polypeptides are useful as vaccines for the treatment or prevention of tung cancer, and for diagnosis and monitoring of such cancer. The compusion of an expense of polynucleotides may be used as probes or primers for inclease for inhibiting expression of tumour polypeptides and proteins in tumour cells specific for a tumorous protein. The collynucleotides may be used as probes or primers for inclease for inhibiting expression of tumour polypeptides and proteins in tumour cells in tumour cells. The present sequence is one of the 183 lung cancer associated polynucleotides

The invention relates to identifying (M1) a candidate p53 pathway condusting agent, by contacting an assay system comprising a purified HM condusting agent, by contacting an assay system comprising a purified HM brosophila) or nucleic acid with a test agent under conditions, where but for the presence of the test agent, the system provides a reference of activity, and detecting a test agent-biased activity of the assay system. Contacting a cell affective in p53 pathway of a cell (comprising contacting a cell affective in p53 tunction with a candidate modulator that specifically binds to a HM polypeptide comprising an HM amino acid cequence, where p53 function is restored, modulating (M3) a p53 pathway in a mammalian cell (comprising contacting the cell with an agent that specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising) (a) obtaining a biological sample from the patient; (b) contacting the sample with a probe for HM expression; (c) comparing the results with a control; and (d) determining whether the comparison indicates a likellhood disease) (M1) is useful. Contacting breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 % expression level. Condulators identified by (M1) are useful in a variety of diagnostic and therapeutic applications, where disease or disorder prognosis is related to defect in the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway such as, angiogenesic, appointed or proliferation of the cell, so that the cell cycles normal colliferation of progression through the cell cycle (M2) and (M3) are also useful for treating defects in the p53 pathway such as angiogenic, also and an analysism and an analysism and an analysism and an analysism and an analysism and an analysism and an analysism and an analysism and an analysism and an analysism and an analysism and an analysism and analysism and analysism and ana

proteins given in ABR43271 to ABR43295, designated NTRAN-1 to NTRAN-25

(1). (1) have eveckatatic, antiatreriosciercic, anticonvulsant,

notropic, neuroprotective, cerebroprotective, anti-HTV, antiallergic,
antiinflammatory, thyromimetic and antidiabetic activities, and can be
useful in diagnosing, treating and preventing diseases or conditions
associated with the decreased expression or overexpression of NTRAN, such
as call proliferative (e.g. cancer, attroke), immune/inflammatory (e.g. applepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AlDS,
allergies), developmental (e.g. hypothyroidism, Cushing's syndrome) or
endocrine (e.g. diabetes) disorders, or infections. They are also useful
in assessing the effects of exogenous compounds on the expression of
nucleic acid and amino acid sequences of NTRAN. The NTRANs or their
fragments are useful in screening compounds for effectiveness as agonist
or antagonist of the polypeptides, or in altering the expression of the
target polymuclectide and compounds that specifically bind to or modulate
the activity of the polypeptide

This cDNA clone, designated 091-132020 (ATCC 98143), which is not full-length, codes for a 46 kDa BRCA1 modulator protein (see AAW37883) that binds to the tumour suppressor gene product BRCA1, and which is characterised by a single leucine zipper domain. 3 cDNA clones (see also AAV29062-63) coding for BRCA1 modulator proteins (see AAW37881-83) were isolated from a HeLa cDNA library using a yeast two-hybrid assay with a GAL4-BRCA1(8-1293) fusion as bait. Vectors and host cells comprising the isolated nucleic acid sequences are claimed, as well as a process for producing BRCA1 modulator protein by culturing these host cells. BRCA1 modulator proteins and nucleic acids can be used to diagnose diseases involving unwanted cell growth, e.g. breast cancer, and to identify compounds that alter BRCA1 interaction with BRCA1 modulators for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ----GCGACTGAGGCCGGACGGGGCGGACGCCGCGCGCGCGCAGAAT 110

The present sequence encodes a modulator protein, that binds to and modulate the activity of the BRCA1 gene product (BRCA1). The BRCA1 protein has been characterized as a tumour suppressor protein.

Alterations in the amino acid sequence of BRCA1 causes breast and ovarian cancers by removing the controls on cell growth and proliferation.

Research has shown that different regions on the BRCA1 molecule have different effects on cell growth and tumour suppression (e.g. full length truncated BRCA1 has no effect on breast cancer cell growth but will inhibit ovarian cancer cell growth. It has been suggested that different host cell factors (e.g. proteins) interact with different regions of the BRCA1 to control its function. The identification of these proteins (e.g. BRCA1 to control its function and treatment of novel diagnostic methods and new therapeutics for identifying and treating cancers caused by changes in the expression or activity of BRCA1 of the BRCAl Claim 1; Fig 3; 35pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and proctate cancer associated antigen precursors (CAAP) respectively. AAB63222 to AAB63467, AAB63466 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019340) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed apecification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                 lated nucleic acids and polypeptides, useful for preventing diagnosing treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GluGluGlyValGlnArgAlaArgGluGluGluGluLysArgLysGluValThrSerHis 260

```

The invention relates to 971 novel human cDNA sequences (ADC29919-CC The invention are lates to 971 novel human cDNA sequences (ADC3089) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of invention further discloses methods of the invention of applying the of the invention. The invention further discloses methods of polymucleotide probes ampliant and antibodies for arriving out the methods of the invention methods for the identification of compounds that modulate the applying and polymetrion and/or monoclonal antibodies for carrying out the methods of the invention and/or monoclonal antibodies for carrying out the methods of the conting sequences corresponding to the compounds that modulate the appropriate sequences corresponding to the compounds that modulate the conting sequences corresponding to the compounds that modulate the conting sequences corresponding to the conting for polypeptides of the invention are useful in diagnostics, drug screening, forensics, game mapping, in the definition of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of disease and other neurodegenerative diseases, anaemia, platelet also used for treating diseases such as Parkinson's diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating be used be been as photocial and as food supplements. The present sequences are propered and as food supplements. The present sequences and not an expending the present sequences and method and sequences and method and products expending the present sequences and method as polype and as food supplements. The present sequence represents a human contig sequence used in an example of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

Claim 1; SEQ ID NO 724; 1185pp; English.

The invention traders to you much that the invention also relates to you much that the properties they encode (AbC30890-AbC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or invention declared condition; kits comprising polymuclectide probes and/or monoclonal antibodies for carrying out the methods of the invention capturession or activity of the polymuclectide and/or polypeptide, and 767 expression or activity of the polymuclectide and/or polypeptide, and 767 expression or activity of the polymuclectide of the invention (AbC31861-AbC32627) and the polymuclectide and/or polypeptide, and 767 expression or activity of the polymuclectide of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of that and products dependent on DNA and amino acid sequences. They are cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human cDNA sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at also used for treating diseases such as Parkinson's disease, Alzhelmer's disease and other neurodegenerative diseases, anaemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or invention relates to 971 novel human cDNA sequences (ADC29919ftp.wipo.int/pub/published_pct_sequences.

The present sequence is that of genomic DNA encoding novel human low density lipoprotein binding protein 3 (LBP-3, see AABB2809). The DNA was isolated from a human genomic library by screening with LBP-3 cDNA (see AAB2501). The open reading frame spans 10 exons. Human LBP-2 nucleic caids are among claimed polynucleotides of the invention that encode novel polypeptides, termed LBPs, capable of binding to native and methylated LDL. Also claimed are isolated LBP polypeptides, and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at risk for atherosclerosis, methods for treating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormality in structure or metabolism of LBP are claimed. Pharmaceutical compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions, are also claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      348
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      345

The present sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, nearestatic and thrombolytic activity, receptor/ligand activity, auti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Racie LA, Merberg D, Treacy M;

Les system provides a reference activity, and detecting a test agent-biased activity of the assay system. Also included are modulating (M2) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator that specifically binds to a HM polypeptide comprising an HM amino acid sequence, where p53 function is restored), modulating (M3) a p53 pathway in a mammalian cell (comprising contacting the cell with an agent that specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising: (a) obtaining a biological sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ds; gene; p53 modifier; cytostatic; cancer; cytostatic;

expression; (c) comparing the sample with a probe for HM expression; (c) comparing the results with a control; and (d) determining whether the comparison indicates a likelihood disease). (M1) is useful for identifying modulators of the p53 pathway. A probe for HM expression is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 % expression level. Modulators identified by (M1) are useful in a variety of diagnostic and therapeutic applications, where disease or disorder prognosis is related to defects in the p53 pathway, such as, angiogenesis, apoptotic or cell proliferation disorders (e.g. cancer). Another two new methods (M2 and M3) are useful for modulating the p53 pathway of a cell, thus restoring the p53 pathway of a cell, undergoes normal the p53 innexion or progression through the cell cycle. (M2) and (M3) are also useful for treating defects in the p53 pathway such as angiogenic, apoptotic or cell proliferation disorders. The present sequence is an HM nucleic acid encoding a p53 pathway modifying protein	Scores: milarity: Similarity: Similarity: S23-8 (1-	305 GluHisIleAspLysValPheLysHisLysAspLeuGlnGlnGlnLeuValAspAlaLys 324 :::	CTCAGCTCATAGCGGGTTATATGGGAGAAGTCTGGCCAGACCAGGCACAGATTCCTTGA GTACCAGTCTGAGAGCGTCAGTGGGTCTGGTGCTTGTGGCTAAAAACCAAACA TAGCCCCTGGGGGGTTTGTGGTGTTTGTGGTTGTTGGGTAAAACCAAACA TAGCCCCTGGGGGGCTTCTGACAGGATCTGGGTTCTTGTCTTTGGAAATTGGTTTTTTTT	HILLINGER ACAGGT-GAGAGCATATAACCTGACCTTGAGCTTCCAAGTTTCCCTCACTGGGCCCCATC CTGGGGGTAGTGAAATGGGACCTCATTCTAGGACTGGCTGTGTCCTGGCTGCTATGACG CCTTGGTTGAGCTTTGTTCTCCCCGGACCTGCACAGTACCTATGTGGTGGTGGTGGTGGTGGTGGTGGTGGTGGTGGTGG

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, and for chomosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cerivity of is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement: (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess brodivering and to produce other types of data and products dependent on DNA and amino acid sequences. AAS6419-AAS94564 represent novel human diagnostic coding sequences. AAS6419-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in partner of the printed specification, but was obtained in the printed specification, but was obtained in the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ------GluGluHisArgAsnSerGlnLysGlnMetLysLeuLeuGlnLysLysGln
